In project #1 of the artist statement, the written piece explains how this project engages with the themes of archival bias and omissions, highlighting their implications for our understanding of history and culture. With the HTML Archive project of creating basic HTML coding, we discussed the topic that aligned with how we wanted the website to be designed.

Before creating a code, we discussed the idea of sousveillance, which involves documenting our daily activities and how we present them. We talked about societal issues and cultural forms and how our use of technology affects society. Lastly, we discussed what imaginary archives might be created.

With the group of three, having a group discussion helped us determine what we should present. We had an idea of creating a response kind of website that makes an interaction with the audience. The theme that we chose to be about is how the audience feels about your aura. With this, we created a color code that expresses emotion and how the audience thinks about it. Based on the audience's response to the aura, the result decides which reaction the audience reacted to the most and least. With this, we have added a few fake responses as an example of an add-on.

When elaborating on the Aura, it reflects on emotions, thoughts, and overall well-being. And each color of aura defines and represents the different feelings or traits. With that understanding, aura can help you know yourself better.
